## PORTABLE CELLULAR PHONE

### BACKGROUND OF THE INVENTION

5 The present invention relates to a portable cellular phone and, more particularly, a portable cellular phone capable of downloading application software in association with music data from a server based on user's selection and also executing the application software (program) downloaded in association with the music data.

10 In the prior art, as set forth in Japanese Patent Publication Hei 11-164058, a portable cellular phone that can select remote music data and listen the music is known. This configuration is shown in FIG.5.

15 In FIG.5, in a portable cellular phone 60 in which a memory device 66 is built in its main body 61, music data that have already been distributed from a record production company to a distribution center by operating push buttons, or the like on the main body 61 to call the distribution center are output to a receiver 64 and a display 62 and also stored in a memory device 66. Thus, the user is able to enjoy the music by reproducing the music data stored in the memory device 66 after the connection of the public network is cut off.

25 Also, in a portable cellular phone 70 which has a memory medium 76 detachably attached to a main body 71, the user can download the music data into a memory medium 76 of the portable

cellular phone 70 by operating push buttons, or the like of the main body 71 to enjoy the music data via a display 72 of the portable cellular phone 70 or a receiver 74, and also the user can enjoy the reproduced music of higher quality by pulling  
5 out the memory medium 76 and then inserting it into other audio unit. In addition, the user can enjoy the music by storing the music data into the memory medium 76 by using other audio unit and then inserting the memory medium 76 into the portable cellular phone 70.

10 However, the conventional portable cellular phone that can select the music and listen it has such problems that contents of listenable music data are identical in specification to the music data distributed from the record production company or via other audio unit and also the user  
15 cannot reproduce the music data according to user's own favorite specifications although lyric lines can be displayed on a display of the portable cellular phone.

#### SUMMARY OF THE INVENTION

The present invention is made to overcome the above  
20 problems in the prior art, and it is an object of the present invention to provide a portable cellular phone capable of downloading an application software in association with music data from a server to main body of the cellular phone.

According the first aspect of the invention, a portable  
25 cellular phone comprises: a music data retrieving means which

retrieves music data; and a downloading means which downloads an application software corresponding to a music data format defined in connection with the music data from a remote server in response to user's selection.

5            Preferably, the music data is input from a storage medium.

            Further, the music data is input via a communication line.

            According to this configuration, the application  
10   software in association with the music data can be downloaded from the server in response to the user's selection.

            Moreover, the portable cellular phone according to the present invention further comprises an application software executing means which executes the application software in  
15   association with the music data in the cellular phone.

            According to this configuration, the application software in association with the music data can be downloaded from the server in response to the user's selection and then the downloaded application software can be executed.

20            Further, according to the portable cellular phone of the present invention, the application software executing means executes a plurality of pieces of application software in parallel simultaneously in association with the music data.

            According to this configuration, the application  
25   software in association with the music data can be downloaded

from the server and then a plurality of pieces of downloaded application software can be executed simultaneously in parallel.

#### BRIEF DESCRIPTION OF THE DRAWINGS

5           Fig. 1 is a view showing a configuration for downloading an application software from a server to a portable cellular phone according to the present invention.

Fig. 2 is a view showing a format of music data according to an embodiment of the present invention.

10           Fig.3 is a flowchart illustrating operations for downloading the application software from the server to the portable cellular phone according to the present invention.

FIG.4 is a block diagram showing a configuration of the portable cellular phone according to the present invention.

15           FIG.5 is a view showing a configuration of a portable cellular phone in the prior art, which can select the music and listen it.

#### DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENT

Embodiments of the present invention will be explained  
20 with reference to FIG.1 to FIG.4 hereinafter.

FIG.1 is a view showing a configuration for downloading application software from a server to a portable cellular phone according to the present invention. In FIG.1, a portable cellular phone 110 of the present invention is constructed such  
25 that music data can be input into a main body of the cellular

phone from a data card 101 into which the music data are input previously, for example. The music data being input into the data card 101 are music data loaded in the music data format such as MP3, MPEG, Quick-Time, etc., for example. Although  
5 not shown, the music data having the above music data format can be purchased (copied) previously from a PC (personal computer) via the Internet or from a dedicated terminal installed in the convenience store, etc., for example, into the data card 101.

10 In this manner, the music data are input into the main body of the cellular phone. In this case, the application software for reproducing the music data is not incorporated in advance into the portable cellular phone at the time of production, but the software for the reproduction is  
15 downloaded from the server.

That is, if the application software for reproduction has already been downloaded from the server in response to the user's selection and then incorporated into the portable cellular phone, the music data can be reproduced based on the  
20 user's favorite specification via a headphone 111 and a displaying means attached to a portable cellular phone 110 by executing the software as it is.

In case the application software for reproduction has not been downloaded from the server and not been incorporated  
25 into the portable cellular phone main body, the user inquires

of an information provider (application storage server) 130  
if the provider has any application softwares, via a  
communication network 120 by using a data communication mode  
of the portable cellular phone. Then, if the user can find the  
5 desired application software, such user instructs the portable  
cellular phone to download such software by operating the  
buttons. After the download, the user can reproduce the music  
data by executing the application software via the headphone  
111 and the displaying means attached to the portable cellular  
10 phone 110 according to the user's favorite specification.

FIG.2 is a view showing a format of the music data. The  
music data of MP3 is shown in FIG.2. To explain further FIG.2,  
"MP3" as a data format identifier, "data MP3" as a data name,  
"11630" byte as a data size of the music data main body, the  
15 data "10, 23, 56, 44, 81, 22, 33, 91, 26, .. ." represented by  
the decimal digit in place of the usual binary digit as the  
content of the music data main body, etc. are loaded in the  
format.

FIG.3 is a flowchart illustrating operations for  
20 downloading the application software from the server to the  
portable cellular phone according to the present invention  
shown in FIG.1. Explanation will be made with reference to  
this flowchart hereunder.

First, in step (abbreviated as "St." in FIG.3) 301, the  
25 user inputs the music data into the main body of the portable

cellular phone. The music data are input by using the data card shown in FIG.1 or an I/O interface (not shown) attached to the main body via the communication line. Various methods other than the personal computer (PC) and the dedicated terminal, as already explained, may be considered as the way of receiving the data into the data card. The technical concept of the present invention is not limited to the data inputting method described above.

Then, in step 302, the user searches the presence of the application software corresponding to the above music data. At this time, information shown in the screen display example DP.302 can be displayed on the displaying means of the portable cellular phone. Then, first the user searches the history indicating whether or not such application software has already been incorporated into the main body of the portable cellular phone. For example, if the application software for the reproduction such as data format MP3, etc. has already been incorporated, the user can know by such search the fact that the application software has already been incorporated into the main body of the portable cellular phone.

If there is no history indicating that such application software has already been input, the application software corresponding to the music data format is not incorporated into the main body of the portable cellular phone. Therefore, the user searches whether or not the application software has been

provider (application storage server) 130 shown in FIG.1 is illustrated. In the screen display example in FIG.3, it is shown that the music reproducing application is further divided into a part 1 and a part 2. The part 1 indicates that the music reproducing application suitable for the classic is registered in the server, and the part 2 indicates that the music reproducing application suitable for the hard rock is registered in the server. In this case, the selecting operation can be omitted if the application software can be identified uniquely.

Then, the process advances to step 305. It is decided whether or not the application software has been incorporated into the main body of the portable cellular phone. As the result of this decision, if the application software has not been incorporated into the main body of the portable cellular phone, the process goes to step 306. In step 306, the application software selected by the user is downloaded from the application storage server. Then, the process proceeds to step 307.

In contrast, in step 305, if the application software has been incorporated into the main body of the portable cellular phone, the process goes to step 307. In step 307, the user executes the application software selected by the user in connection with the data. At this time, if the user has selected the karaoke application, it is possible to display

the screen as shown by the screen display example DP.307 and lyric lines, on which a singing position is indicated, on the displaying means of the portable cellular phone. The process is ended after the execution of the application software is finished.

FIG.4 is a block diagram showing a configuration of the portable cellular phone according to the present invention. In FIG.4, the constituent portion for the normal radio telephone communication serving as the portable cellular phone will not explained again since such portion has been widely known by the person skilled in the art. Only the constituent portion that is associated with the present invention will be explained hereunder.

FIG.4 will be explained in compliance with the above explanation in FIG.3 hereunder. For example, a music storing medium 401 (containing the above data card, and MD, DVD, CD-ROM, etc. may be used) in which the music data loaded by the MP3 data format is stored is input into the main body of the unit (step 301).

Then, when the user sends a command to a general controlling portion 404 via a button input controlling portion 403 by operating a button inputting portion 402, the location of the application software corresponding to the above music data is searched. If the program has already downloaded and then incorporated into the main body of the portable cellular

phone, the program has stored in a program memory 413.

Therefore, the general controlling portion 404 causes a program execution controlling portion 414 to operate to read contents stored in the program memory 413.

5           At this time, information as shown in the screen display example DP.302 is displayed on a displaying portion 409. If it is found based on the search that the application software is incorporated into the main body of the portable cellular phone, and the user sets the portable cellular phone to the data communication available mode, for example, to inquire of 10 the server if any application softwares are registered in the remote server. At this time, the general controlling portion 404 and a radio wave transmit/receive controlling portion 405 are operated. Since inquired results are displayed on the displaying portion 409 as the list, the user can find based 15 on this display that the corresponding application software is registered in the server (step 302).

          If the application software can be found in either the main body of the portable cellular phone or the remote server, 20 such application software is displayed on the displaying portion 409. Therefore, the user can select the user's favorite application software by operating the button inputting portion 402 (steps 303, 304, DP.304).

          Since the selected information is given to a program 25 selection controlling portion 411, the general controlling

portion 404 starts to prepare for the executing operation of the program. Then, if the user's favorite application software is downloaded from the server, the user operates the general controlling portion 404 and the radio wave transmit/receive controlling portion 405 to download the program from the remote server.

The downloaded program is input into a program downloading portion 412, and also stored in the program memory 413. If the program has already been downloaded and incorporated into the main body of the portable cellular phone, the program has been stored in the program memory 413. Therefore, the user can fetch the program from the program memory 413 in response to the instruction issued from the program selection controlling portion 411.

The execution of the application program is carried out based on control of the program execution controlling portion 414. The music data can be reproduced by a headphone 111 via a music amplifying portion 415 and a receiver jack 416, while the data such as the picture, the lyric lines, etc. are displayed on the displaying portion 409.

The program execution controlling portion 414 is formed of many microprocessors. Therefore, in order to execute a plurality of pieces of application software, the program execution controlling portion 414 is constructed such that a plurality of microprocessors are provided to operate

simultaneously in parallel with each other.

As described above, according to the portable cellular  
phone of the present invention, there can be achieved such  
advantages that the application software in association with  
5 the music data can be downloaded from the server in response  
to the user's selection and also the downloaded program can  
be executed in association with the music data.

0904221 031800

# ABSTRACT OF THE DISCLOSURE

Music data stored in a data card 101 is input into a portable cellular phone 110, and also a plurality of pieces  
5 of application software (131, 133) suitable for a music data format defined in connection with the music data is selected by a user and downloaded from a remote server 130. According to this configuration, the application software in association with the music data can be downloaded from the server in  
10 response to the user's selection.
